---

This moving profile depiction of a mature woman wearing a white cap occupies an unusual place within Rembrandt van Rijn's painted oeuvre. Although clearly representing a specific individual, the master seems not to have conceived this painting as a formal portrait; instead, the woman's focused gaze and raised eyebrows make it appear as though she has been plucked from the stream of her daily responsibilities. Moreover, her flat plain collar identifies her as a servant who would have occupied a social position far beneath those who could afford to sit for Rembrandt around 1640, when he executed this work. Rembrandt seems to have concerned himself here primarily in determining how the effects of direct and reflected light affect the characterization of the figure in such a study. Light strikes the woman's head from behind while reflected light illuminates her face. Rembrandt enhanced these light effects through his different levels of finish, ranging from fully built-up paint on her cap, forehead and cheek to the more thinly and loosely executed shaded areas.

Throughout much of its history, this work had a different appearance. By the mid-nineteenth century, several areas of the painting had been reworked in an effort to recast it as a formal portrait (**fig 1**). The plain collar had been painted out in a decisive manner by a later hand: an intervening layer of black was used to ensure it was covered completely before a more stylish fur collar was painted in its place. Notably, however, the *oorijzer*, or "ear iron," was left fully visible. This metal band was fitted inside the bonnet to hold it in place around the head and over the ear, and was normally hidden behind the earflap of the bonnet. The fact that this metal band was left visible when the repainting was done suggests that its function was not recognized and that it was believed to be characteristic of normal dress.

When this painting first entered the literature (in its altered state), it was included in the master's oeuvre without any reservations. John Smith was the first to cite it in 1836,<sup>[1]</sup> and his positive assessment was subsequently reaffirmed in the early twentieth century by Cornelis Hofstede de Groot, Max Friedländer, Hermann Voss, and Abraham Bredius.<sup>[2]</sup> Wilhelm Valentiner was particularly vigorous in his support in publications of 1921, 1930, and 1931.<sup>[3]</sup> A change in judgment occurred in 1936, when Abraham Bredius abandoned his earlier position and omitted the panel from his catalogue of Rembrandt's paintings.<sup>[4]</sup> No scholar subsequently challenged this sidelining of the painting until Ernst van de Wetering's

## Comparative Figures

**Fig 1.** *Study of a Woman in a White Cap*, RR-101, before restoration (photograph courtesy of Martin Bijl)

**Fig 2.** Philips Koninck, *The Young Seamstress*, 1671, oil on canvas, 25.5 × 20 cm, The State Hermitage Museum, St. Petersburg, inv. 628

**Fig 3.** Rembrandt van Rijn, *Portrait of the Mennonite Preacher Cornelis Claesz Anslø and His Wife Aeltje Gerritsdr Schouten*, 1641, oil on canvas, 176.5 × 206.9 cm, Staatliche

reassessments in 2005 and 2006, subsequent to the conservation of the painting by Martin Bijl in 2003–5.<sup>[5]</sup>

Museen zu Berlin,  
Gemäldegalerie, Berlin, inv. 828L

Van de Wetering initially focused his discussion on the physical adjustment of the panel and later overpainting that had transformed this head study into a formal portrait. Aside from the overpainting of the color, additions had been made to the panel's original arched upper corners to create a rectangular format conventional for portraits.<sup>[6]</sup> The detail of the ear iron is further evidence of the informal nature of this work; indeed, the only other instance of its exposure in a Dutch painting is in a genre scene by Rembrandt's follower Philips Koninck (**fig 2**). The similarity of the presentation of this feature suggests that Koninck followed Rembrandt's painting as a model, and thus may have seen it in Rembrandt's studio.

Although the conservation treatment revealed that areas of the face had been overcleaned, Van der Wetering pointed to the remarkably strong passages in the cap, ear and ear iron, as well as in the cheek and jaw, as exemplary of Rembrandt's unique ability to model forms by using a combination of loose and rhythmic paint handling. The relative softness of the shaded parts of the face, Van der Wetering rightly argued, was consistent with Rembrandt's approach to such study heads.

Rembrandt's interest in rendering this woman's face in indirect light may relate to an artistic challenge he was facing around 1640 in planning his double portrait of Cornelis Claesz Anslo and his wife of 1641 (**fig 3**). The interaction of these two conversing figures required that one face would be cast in shadow—in this case, the man's—while the other was lit. In both works Rembrandt sought to balance a convincing rendering of the effect of strong light with a wide range of modulated shadows and reflected light. These latter effects are particularly evident in *Study of a Woman in a White Cap* in the middle tones of reflected light on the nose, cheeks, chin and forehead.

Dendrochronological analysis of the oak panel support relates this painting to three other works from Rembrandt's workshop, each of which was painted on a panel from the same tree.<sup>[7]</sup> These comprise the authentic *Self-Portrait* of 1633,<sup>[8]</sup> *Portrait of a Man* (formerly identified as Willem Burggraeff), likely not autograph,<sup>[9]</sup> and a landscape of around 1640 in the Wallace Collection, certainly by a pupil.<sup>[10]</sup> Van de Wetering has argued

that the Leiden Collection painting similarly dates to around 1640. He notes not only its connection to the Berlin double portrait but also to a cluster of other works painted at this time that likewise demonstrate a combination of loose and regular handling, such as *Still Life with Two Dead Peacocks and a Girl*,<sup>[11]</sup> *Hunter with a Dead Bittern*,<sup>[12]</sup> and *Landscape with a Stone Bridge*.<sup>[13]</sup>

In each of these other works of about 1640, Rembrandt extended his range of style and subject matter beyond conventional pictorial types. In the same experimental spirit he made the cap, the ear iron, and the woman's cheek the focal points of this portrait-like study, defining them with solidity and brilliance only he commanded. While this painting served Rembrandt primarily as a study, and perhaps also as a teaching demonstration of an evocative lighting scenario, he also seized the chance to suggest his subject's inner fortitude in her unfazed, slightly humored expression. It is also possible that this powerful image served as a demonstration to a prospective portrait client of the effective presentation of a head with the face in shadow. All of these considerations indicate the significance of *Study of a Woman in a White Cap* for Rembrandt and his oeuvre. This compelling image is also of great significance for the Leiden Collection, for it is the first painting by Rembrandt to enter this collection.

-David DeWitt

6. After Rembrandt, *Woman in a White Cap*, with arched top, location unknown (previously or still in the Ferrari Collection, Bergamo).

### Versions Notes

### Technical Summary

The support is a single plank of vertically grained, rectangular Eastern Baltic oak with rounded upper corners.<sup>[1]</sup> The 9.5 cm-wide center section of the upper panel edge is cut horizontally and does not form a true arch as does the period copy from a Utrecht private collection, which suggests the center of the upper panel edge has been trimmed approximately 3 cm in height.<sup>[2]</sup> The panel has no bevels and has been thinned.

Triangular wood additions square off the rounded upper corners, and narrow vertical wood additions along the left and right edges widen the format.<sup>[3]</sup> The painted composition has been extended onto the four additions, and narrow unpainted shims have been glued to the left, right, and upper edges for framing purposes. The entire composite panel has been marouflaged to a 0.6 cm-thick hardwood board with a 0.1 cm-thick vertically grained oak veneer backing. Two auction house labels have been applied to the reverse, but there are no wax seals, import stamps, stencils or panel maker's marks.

According to the January 2006 Sotheby's sale catalogue entry for this lot, a rectangular panel addition, approx. 7 cm high, had been previously adhered along the entire width of the lower edge. The composition had been extended onto this addition and an eighteenth-century stenciled cypher of Furst Wenzel Anton Kaunitz (1711–94), one of the principal figures of the Austrian

Enlightenment, had been applied to the lower right corner. This addition was removed during the painting's restoration in 2002–5. Although it was apparently included as part of the lot when the painting was sold, its location is now unknown.<sup>[4]</sup>

Approximately 3 cm is missing from the original arched portion of upper edge and approximately 7 cm is missing from the lower edge. A diagram depicting the addition removed during restoration in 2002–5 is available in The Leiden Collection archive files.

Peter Klein's 2004 dendrochronology report states that "die Anstuckung der Eichenholztafel," presumably referring to the oak addition removed from the lower edge, stems from southern Germany and has an earliest fell date of 1639 with an earliest use date of 1641. However, according to Klein a more plausible fell date would be 1645, 1649, or 1654 plus x, with a more likely first use date of 1651 or after.<sup>[5]</sup>

A light, warm-colored, thinly and evenly applied ground shows through the thinly and smoothly applied passages of paint along the background, fur lining, and dark garment. The flesh tones of the figure's face, the gray hair, and the white cap have been applied in a thick paste with low brushmarkings and low impasto.

No underdrawing is readily apparent in infrared images captured at 780–1000 nanometers and no compositional changes were revealed; however, restorations along the profile of the figure's face are visible.

The painting is unsigned and undated.

The painting has not undergone conservation treatment since its acquisition and remains in a good state of preservation.

### Technical Summary Endnotes

1. The characterization of the wood is based on dendrochronology reports by Peter Klein and Ian Tyers.
2. The curves of the two upper corners were extended on a Mylar template and the distance between the midpoint of the arch formed and the horizontal panel edge was measured. Unfortunately, the narrow shim glued to the edge makes it impossible to determine if the upper edge is in fact original and, if not, how or when it may have been cut.
3. Left addition is 2 cm wide; right addition is 0.5 cm wide.
4. It appears this addition may have been inadvertently left behind at Sotheby's when the lot was purchased.

5. It is not entirely clear why this early oak addition was removed and not simply framed out, or why the narrow wood shim glued to the upper panel edge was not removed and dendrochronology attempted on the upper endgrain instead.
